Summary

Special local transport enables the crew tracker (CT) to set customized transport times to and from a layover. The special local transport times are used when regarding points and in some cases (Norwegian cabin crew) also in the rest calculations.

TABLE OF CONTENTS

1 Special Local Transport

Special Local Transport Times are set via the "Set Local Transport Time" form.

Note: The special local transport times override all other transport times available on the rest, including default transport times and hotel-specific transport times.

1.1 User interface

Special Local Transport is always set for a layover and consists of two separate times, to the rest and from the rest. This is mirrored in the "Set Local Transport Time" form. An example of this form is showed below:

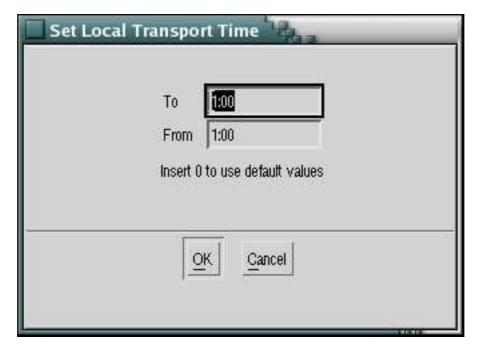

Figure [1]   The "Set Local Transport Time" form which is used to set the special local transport times.

The "To" and "From" time fields is used by the crew tracker (CT) to input the desired special local transport times.

Input field format: The format of the input is h:mm where h stands for the hours and mm for minutes. :mm is also allowed. It is allowed for "mm" to exceed 60 and if this is the case, the form will automatically convert it into the form "h:m" (e.g. if ":100" is written in either input field, it will be automatically converted into "1:40").

Input field limitations: The input in each field may not be lower than 10 minutes nor may it exceed 6 hours. The value 0 is excepted from this rule and is used to denote that the CT wants to set the "default time" (see below)

Input field default values: It is always possible to remove any set special local transport time in one or both directions by entering the value "0" into one or both input fields.

Input field initial values: The initial values of the input fields are the values which are currently used. This may be previously set special local transport times, hotel transport times or default transport times.
